

How to Charge a Chainsaw Using a Solar Panel

1. A solar panel collects the energy of the sun, the more panels available, the more energy collected.

2. A power inverter takes the collected energy from the solar panel and allows for it to be converted into a usable form.

3. A battery charging dock is plugged into the converter and the battery stores the converted energy until it is ready for use.

4. Placed the charged battery in the chainsaw and go to work. Charging a second battery while working helps to minimize downtime.
