

Grow Tomatoes ALL YEAR

Enjoy fresh tomatoes by growing them in your window!

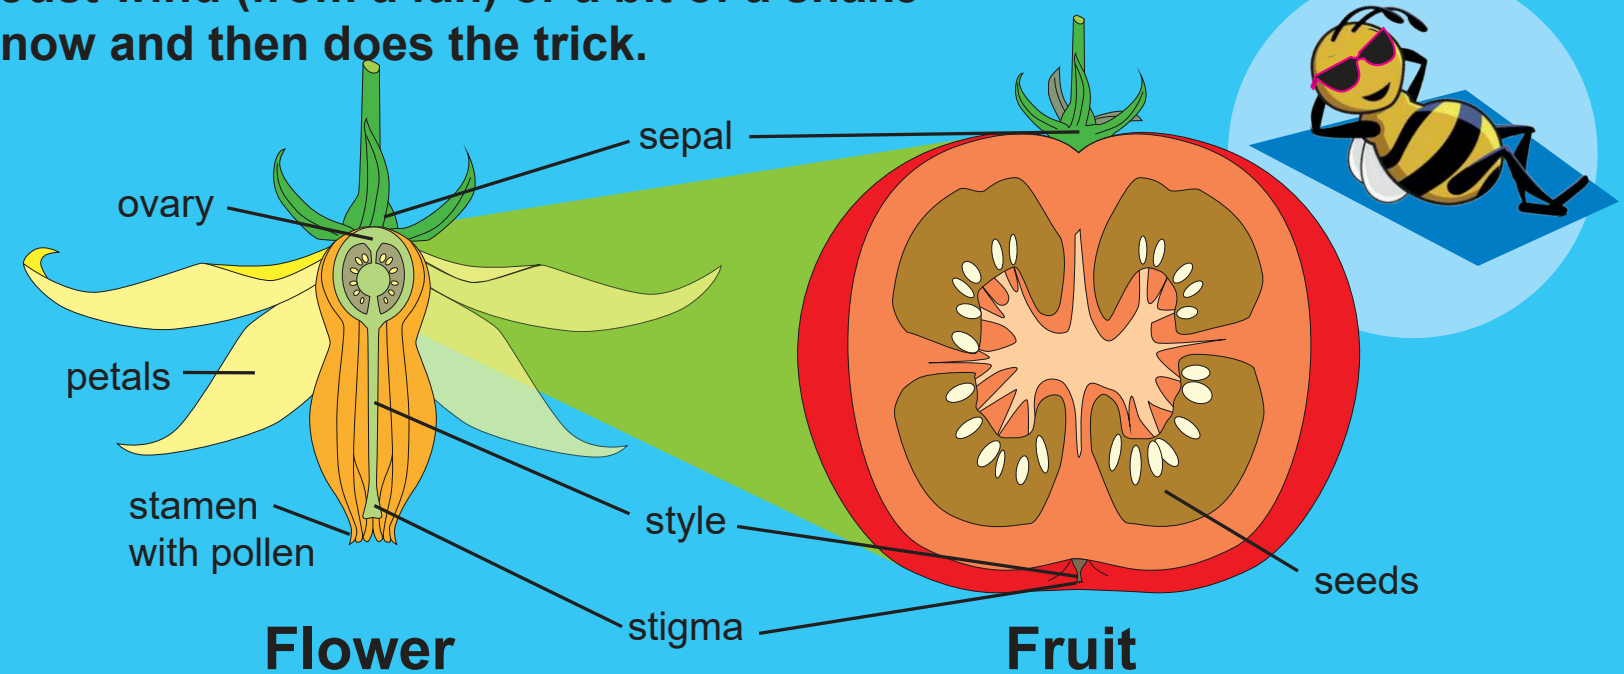

DID YOU KNOW?

Leaves have "BREATHING HOLES" on the underside called stomata.

Plants have HORMONES too! They control how much each part grows, the direction it grows, when to flower and more!

Tomatoes are **self-fertilizing**. The male and female parts are **TOGETHER** in each flower. They don't need insects to carry pollen. Just wind (from a fan) or a bit of a shake now and then does the trick.

Roots "know" to grow down.

They "feel" **GRAVITY!**

Tomatoes are actually **BERRIES** (soft flesh covering many seeds)

YES, they are technically a fruit!

Some plants, including tomatoes, are either **indeterminate** (ever-bearing) or **determinate** (ripen all at once).
